# Barchan Dunes

# Barchan Dune

- A crescentic dune that faces the wind
- Conditions:
  - Well sorted sediment
  - Unimodal winds
  - No vegetation

# Key Processes

- ✓ 1. Aeolian sediment transport (transport-limited)
- 2. Spatially varying wind field due to local morphology
- 3. Avalanching

# Wind Field

Spatial variation in wind field in response to morphology

Stream lines over flat bed

# Wind Field

Spatial variation in wind field in response to morphology

- Dune evolution and migration

# Wind Field

Spatial variation in wind field in response to morphology

- Dune evolution and migration

- **Implementation:** Analytical perturbation theory (Weng, 1991)  
(Implemented in AEOLIS by Pieter Rauwoens @KU Leuven)

# Wind Field

- Theory only suitable for “smooth” hills
  - Does not describe flow separation
- **Implementation:** Separation bubble (Sauermann, 2001)

- Assumption: Inside separation bubble:  $\tau = 0$

# Avalanching

- Slopes steeper than angle of repose ( $33^\circ$  for dry sand)  $\rightarrow$  Avalanching

# Barchan dune simulation

Simulation time 2 year  
Wind velocity 6 m/s

# Parabolic Dunes

# Key Processes

- ✓ 1. Aeolian sediment transport (transport-limited)
- ✓ 2. Spatially varying wind field due to local morphology
- ✓ 3. Avalanching

# Vegetation

# Vegetation

- Vegetation growth related to bed level change
  - Optimal growth at stable bed
- Differs for dune-building species
  - Sedimentation can stimulate growth
- **Implementation:**  
Vegetation formula (Duran, 2006)

 Vegetation     No vegetation due to erosion or too much sedimentation

# Embryo Dunes

# Key Processes

- ✓ 1. Aeolian sediment transport (transport-limited)
- ✓ 2. Spatially varying wind field due to local morphology
- ✓ 3. Avalanching
- ✓ 4. Vegetation

# Vegetation

# Vegetation

- Vegetation establishment + lateral propagation
- Implementation (Keijsers et. al 2016):
  - Probabilistic value (Lateral: only for adjacent cells)
  - Spatially uniform (over-simplified)

# Marine influences

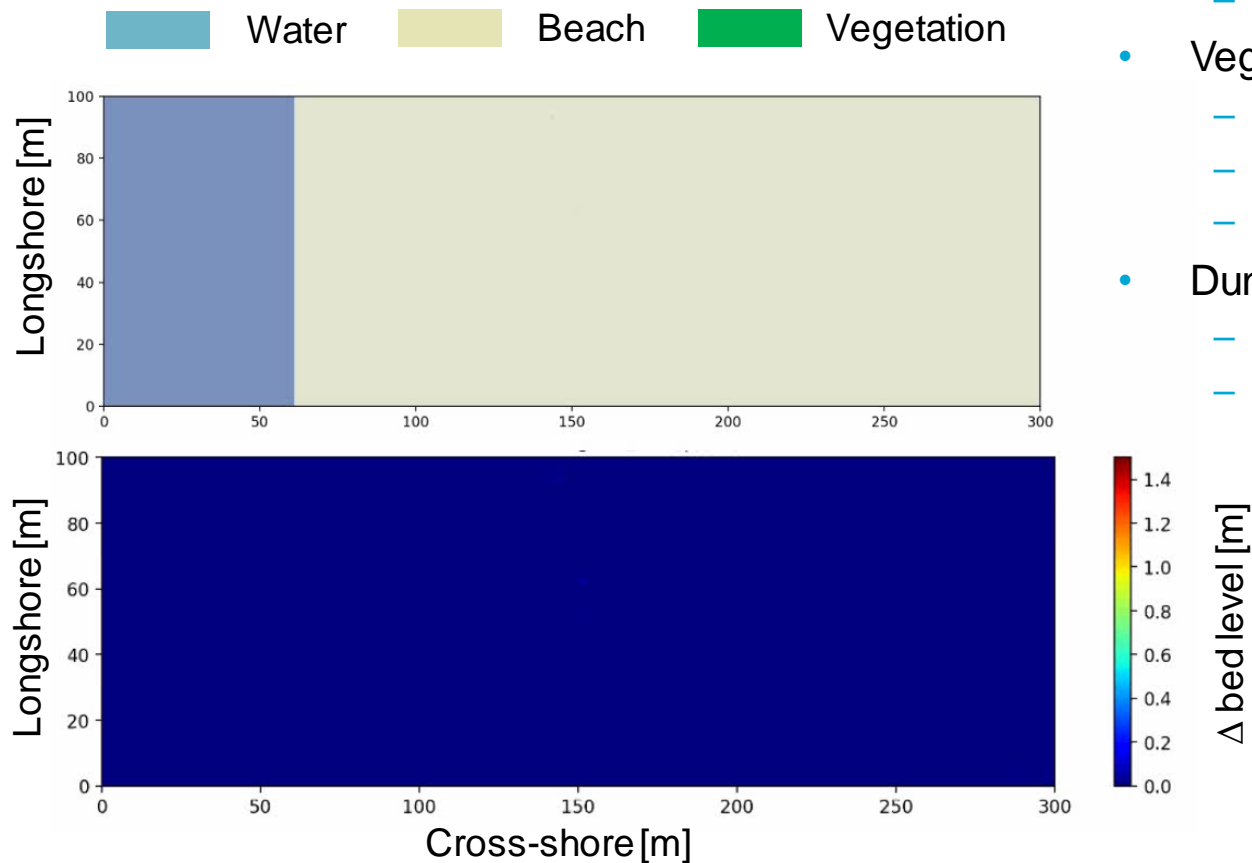

- Direct erosion / accretion on the bed
- Destroying vegetation
- Increase velocity threshold due to surface moisture content

# Embryo dune simulation

- Hydrodynamics
  - Vegetation
  - Dunes
- Vegetation
  - Establishment
  - Lateral
  - Growth
- Dunes
  - Growth
  - Coalescing
